2D image transformations

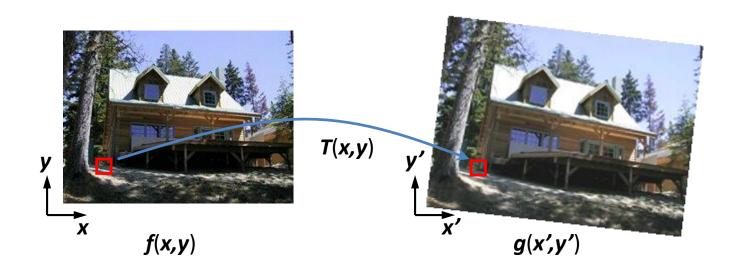

Name	Matrix	# D.O.F.	Preserves:	Icon
translation	$egin{array}{ c c c c c c c c c c c c c c c c c c c$	2	orientation $+ \cdots$	
rigid (Euclidean)	$igg[egin{array}{c c} R & t \end{bmatrix}_{2 imes 3}$	3	lengths + · · ·	\Diamond
similarity	$\left[\begin{array}{c c} sR & t\end{array}\right]_{2\times 3}$	4	angles $+\cdots$	\Diamond
affine	$\left[egin{array}{c} oldsymbol{A} \end{array} ight]_{2 imes 3}$	6	parallelism $+\cdots$	
projective	$\left[egin{array}{c} ilde{H} \end{array} ight]_{3 imes 3}$	8	straight lines	

These transformations are a nested set of groups

• Closed under composition and inverse is a member

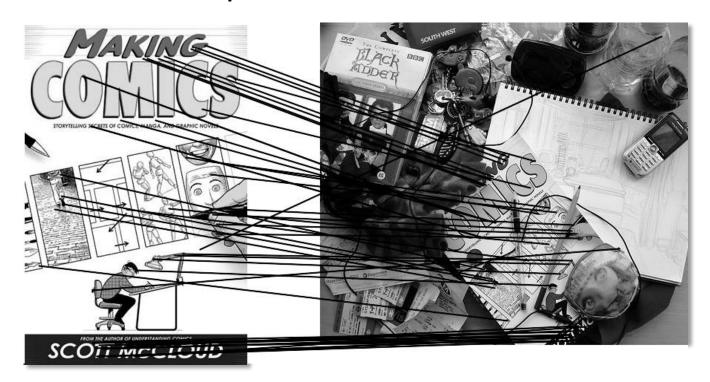

Last time: Image Warping

• Given a coordinate xform (x',y') = T(x,y) and a source image f(x,y), how do we compute an xformed image g(x',y') = f(T(x,y))?

Computing transformations

- Given a set of matches between images A and B
 - How can we compute the transform T from A to B?

Find transform T that best "agrees" with the matches

Computing transformations

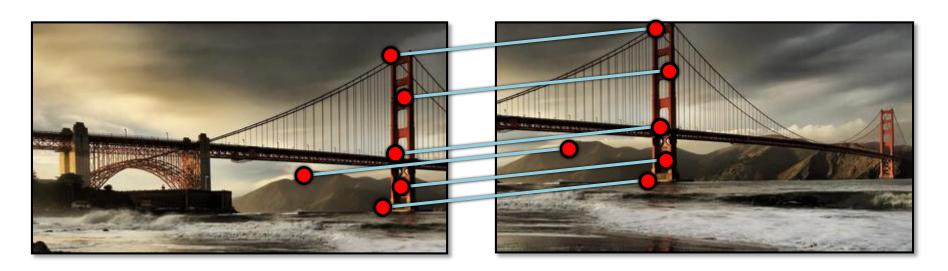

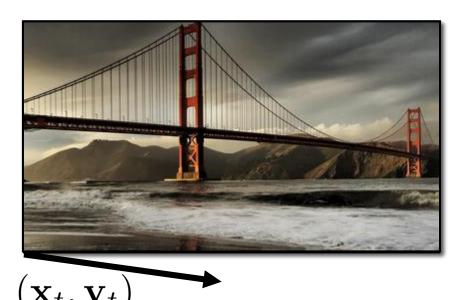

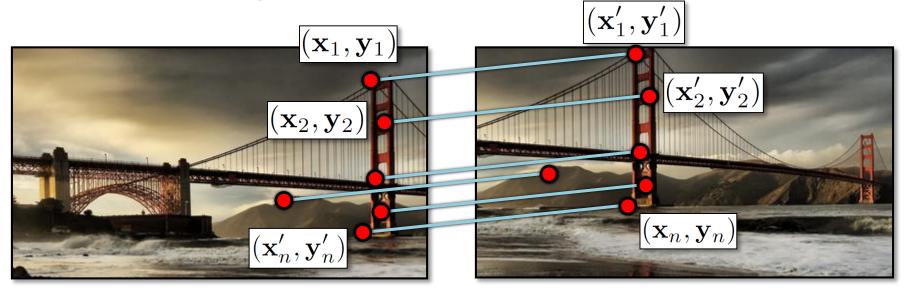

Simple case: translations

How do we solve for $(\mathbf{x}_t, \mathbf{y}_t)$?

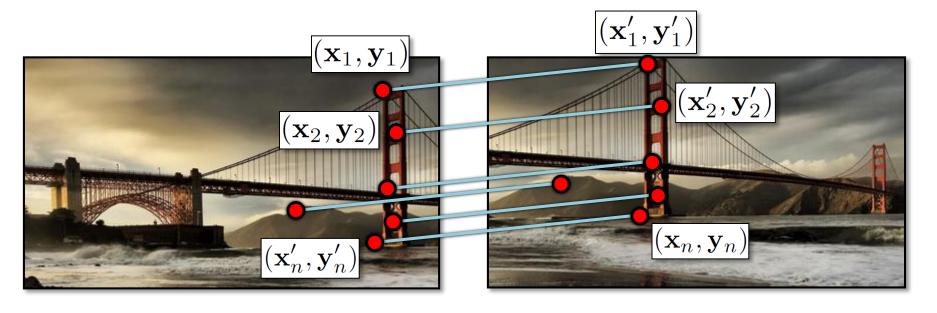

Simple case: translations

Displacement of match
$$i$$
 = $(\mathbf{x}_i' - \mathbf{x}_i, \mathbf{y}_i' - \mathbf{y}_i)$

$$(\mathbf{x}_t, \mathbf{y}_t) = \left(\frac{1}{n} \sum_{i=1}^n \mathbf{x}_i' - \mathbf{x}_i, \frac{1}{n} \sum_{i=1}^n \mathbf{y}_i' - \mathbf{y}_i\right)$$

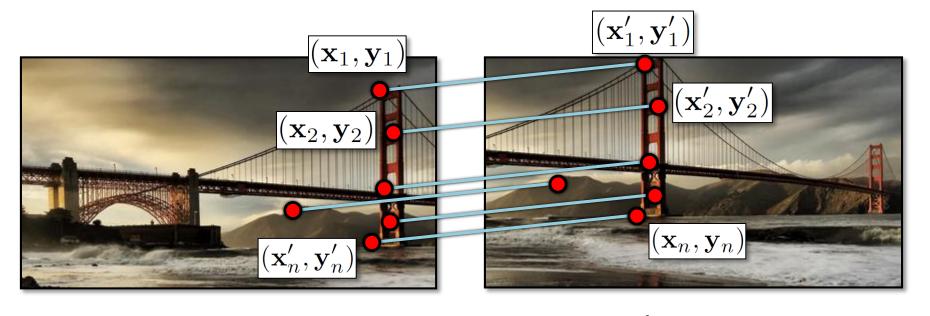

Another view

$$\mathbf{x}_i + \mathbf{x_t} = \mathbf{x}_i'$$
 $\mathbf{y}_i + \mathbf{y_t} = \mathbf{y}_i'$

- System of linear equations
 - What are the knowns? Unknowns?
 - How many unknowns? How many equations (per match)?

Another view

$$\mathbf{x}_i + \mathbf{x_t} = \mathbf{x}_i'$$

$$\mathbf{y}_i + \mathbf{y_t} = \mathbf{y}_i'$$

- Problem: more equations than unknowns
 - "Overdetermined" system of equations
 - We will find the *least squares* solution

Least squares formulation

• For each point $(\mathbf{x}_i, \mathbf{y}_i)$

$$egin{array}{lll} \mathbf{x}_i + \mathbf{x_t} &=& \mathbf{x}_i' \ \mathbf{y}_i + \mathbf{y_t} &=& \mathbf{y}_i' \end{array}$$

we define the residuals as

$$r_{\mathbf{x}_i}(\mathbf{x}_t) = (\mathbf{x}_i + \mathbf{x}_t) - \mathbf{x}_i'$$

 $r_{\mathbf{y}_i}(\mathbf{y}_t) = (\mathbf{y}_i + \mathbf{y}_t) - \mathbf{y}_i'$

Least squares formulation

Goal: minimize sum of squared residuals

$$C(\mathbf{x}_t, \mathbf{y}_t) = \sum_{i=1}^n \left(r_{\mathbf{x}_i}(\mathbf{x}_t)^2 + r_{\mathbf{y}_i}(\mathbf{y}_t)^2 \right)$$

- "Least squares" solution
- For translations, is equal to mean displacement

Least squares formulation

Can also write as a matrix equation

$$\begin{bmatrix} 1 & 0 \\ 0 & 1 \\ 1 & 0 \\ 0 & 1 \\ \vdots \\ 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x_t \\ y_t \end{bmatrix} = \begin{bmatrix} x'_1 - x_1 \\ y'_1 - y_1 \\ x'_2 - x_2 \\ y'_2 - y_2 \\ \vdots \\ x'_n - x_n \\ y'_n - y_n \end{bmatrix}$$

Least squares

$$At = b$$

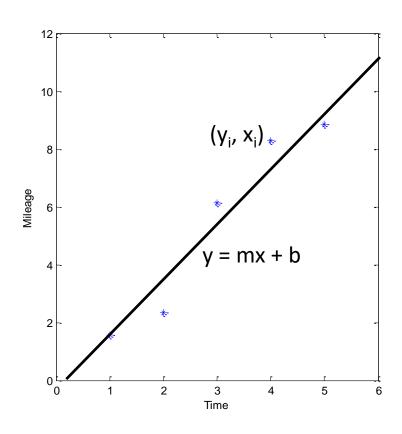

• Find **t** that minimizes

$$||{\bf At} - {\bf b}||^2$$

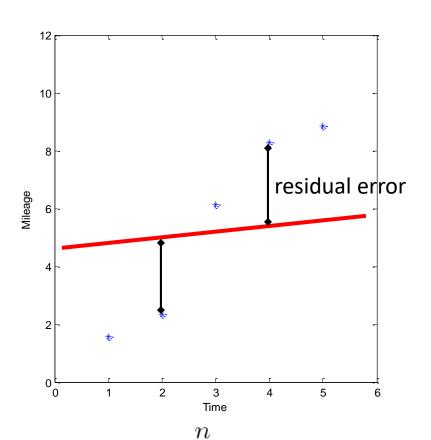

• To solve, form the *normal equations*

$$\mathbf{A}^{\mathrm{T}}\mathbf{A}\mathbf{t} = \mathbf{A}^{\mathrm{T}}\mathbf{b}$$
$$\mathbf{t} = (\mathbf{A}^{\mathrm{T}}\mathbf{A})^{-1}\mathbf{A}^{\mathrm{T}}\mathbf{b}$$

Least squares: linear regression

Linear regression

$$Cost(m, b) = \sum_{i=1}^{\infty} |y_i - (mx_i + b)|^2$$

Linear regression

$egin{bmatrix} x_1 \ x_2 \end{bmatrix}$	1 1	$oxed{ egin{array}{c c} \hline m \end{array}}$	$\left[egin{array}{c} y_1 \ y_2 \end{array} ight]$
•			•
$\lfloor x_n \rfloor$	1 _		y_n

Affine transformations

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} a & b & c \\ d & e & f \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

- How many unknowns?
- How many equations per match?
- How many matches do we need?

Affine transformations

Residuals:

$$r_{x_i}(a, b, c, d, e, f) = (ax_i + by_i + c) - x'_i$$

 $r_{y_i}(a, b, c, d, e, f) = (dx_i + ey_i + f) - y'_i$

Cost function:

$$C(a, b, c, d, e, f) = \sum_{i=1}^{n} (r_{x_i}(a, b, c, d, e, f)^2 + r_{y_i}(a, b, c, d, e, f)^2)$$

Affine transformations

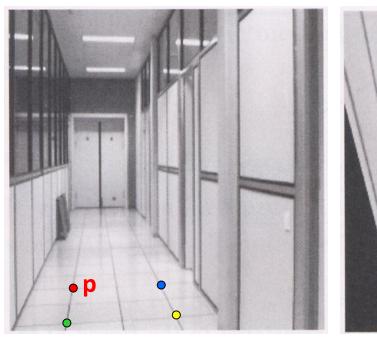

Matrix form

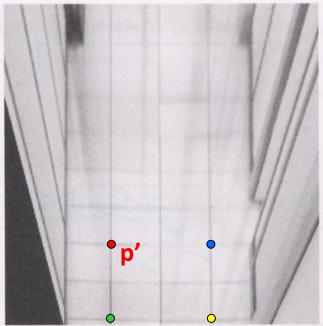

$$\begin{bmatrix} x_1 & y_1 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & x_1 & y_1 & 1 \\ x_2 & y_2 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & x_2 & y_2 & 1 \\ \vdots & & & & & \\ x_n & y_n & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & x_n & y_n & 1 \end{bmatrix} \begin{bmatrix} a \\ b \\ c \\ d \\ e \\ f \end{bmatrix} = \begin{bmatrix} x'_1 \\ y'_1 \\ x'_2 \\ y'_2 \\ \vdots \\ x'_n \\ y'_n \end{bmatrix}$$

$$\mathbf{A} \qquad \mathbf{t} = \mathbf{b}$$

2n x 6

Homographies

To unwarp (rectify) an image

- solve for homography H given p and p'
- solve equations of the form: wp' = Hp
 - linear in unknowns: w and coefficients of H
 - H is defined up to an arbitrary scale factor
 - how many points are necessary to solve for H?

Solving for homographies

$$\begin{bmatrix} x_i' \\ y_i' \\ 1 \end{bmatrix} \cong \begin{bmatrix} h_{00} & h_{01} & h_{02} \\ h_{10} & h_{11} & h_{12} \\ h_{20} & h_{21} & h_{22} \end{bmatrix} \begin{bmatrix} x_i \\ y_i \\ 1 \end{bmatrix}$$

$$x_i' = \frac{h_{00}x_i + h_{01}y_i + h_{02}}{h_{20}x_i + h_{21}y_i + h_{22}}$$
$$y_i' = \frac{h_{10}x_i + h_{11}y_i + h_{12}}{h_{20}x_i + h_{21}y_i + h_{22}}$$

Not linear!

$$x'_i(h_{20}x_i + h_{21}y_i + h_{22}) = h_{00}x_i + h_{01}y_i + h_{02}$$

 $y'_i(h_{20}x_i + h_{21}y_i + h_{22}) = h_{10}x_i + h_{11}y_i + h_{12}$

Solving for homographies

$$x'_i(h_{20}x_i + h_{21}y_i + h_{22}) = h_{00}x_i + h_{01}y_i + h_{02}$$

 $y'_i(h_{20}x_i + h_{21}y_i + h_{22}) = h_{10}x_i + h_{11}y_i + h_{12}$

$$\begin{bmatrix} x_{i} & y_{i} & 1 & 0 & 0 & 0 & -x'_{i}x_{i} & -x'_{i}y_{i} & -x'_{i} \\ 0 & 0 & 0 & x_{i} & y_{i} & 1 & -y'_{i}x_{i} & -y'_{i}y_{i} & -y'_{i} \end{bmatrix} \begin{bmatrix} h_{00} \\ h_{01} \\ h_{02} \\ h_{10} \\ h_{11} \\ h_{12} \\ h_{20} \\ h_{21} \\ h_{22} \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Solving for homographies

$$\begin{bmatrix} x_1 & y_1 & 1 & 0 & 0 & 0 & -x_1'x_1 & -x_1'y_1 & -x_1' \\ 0 & 0 & 0 & x_1 & y_1 & 1 & -y_1'x_1 & -y_1'y_1 & -y_1' \\ \vdots & & & \vdots & & & & \\ x_n & y_n & 1 & 0 & 0 & 0 & -x_n'x_n & -x_n'y_n & -x_n' \\ 0 & 0 & 0 & x_n & y_n & 1 & -y_n'x_n & -y_n'y_n & -y_n' \end{bmatrix} \begin{bmatrix} n_{00} \\ h_{01} \\ h_{02} \\ h_{10} \\ h_{11} \\ h_{12} \\ h_{20} \\ h_{21} \\ h_{22} \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ \vdots \\ 0 \\ 0 \end{bmatrix}$$

Defines a least squares problem: minimize $\|\mathbf{A}\mathbf{h} - \mathbf{0}\|^2$

- Since ${f h}$ is only defined up to scale, solve for unit vector $\hat{{f h}}$
- Solution: $\hat{\mathbf{h}}$ = eigenvector of $\mathbf{A}^T\mathbf{A}$ with smallest eigenvalue
- Works with 4 or more points

Questions?

Image Alignment Algorithm

Given images A and B

- 1. Compute image features for A and B
- 2. Match features between A and B
- 3. Compute homography between A and B using least squares on set of matches
